## Highlights of Changes in 2.1.1.2

ID: Backend able to sync customer info, spectacles and contact lenses history from current Account book to others.

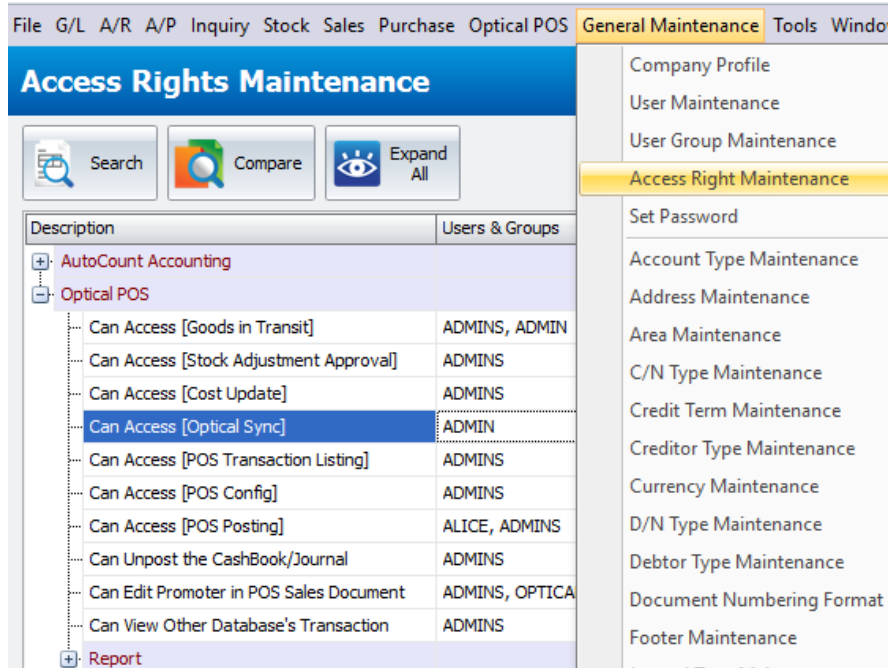

This feature is for those users with who have different outlet with separate accountbook. Technically, their customer base is the same therefore we have enhanced that the customer info can be synced amongst all the accountbook. So that customer A can be identify by all the accountbook if he had purchased before at any one of the outlet.

Optical Sync will create/overwrite existing customer info, spectacle and contact lenses history from current account book to others (following Server Configuration listing).

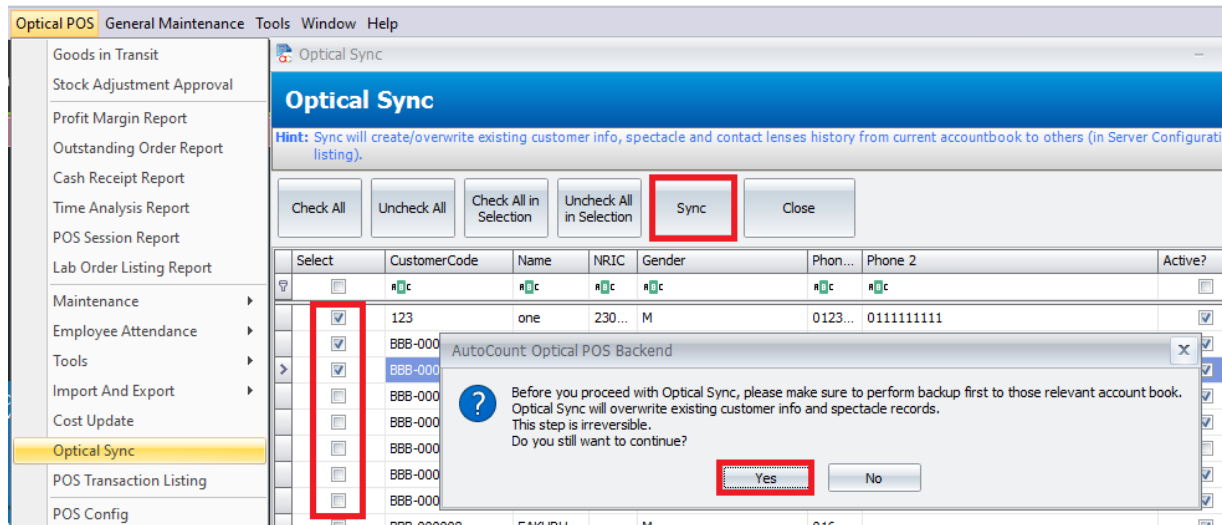

Before you proceed with Optical Sync, **please make sure to perform backup first to those relevant account book.**

You need give access right to access this function. Login Optical Backend > General Maintenance > Access Right Maintenance > Optical POS > add User ID / User Group into Can Access [Optical Sync]

Go to Optical POS menu > Optical Sync > check it which customer you need to sync > Sync > Yes

Click OK
